

Atividade 2

1.6 Passo 11

Print da atividade 1.6: Execução da ferramenta demonstrando a captura de informações simuladas de acesso, incluindo identificação do IP (127.0.0.1) e registro de credenciais de teste, com salvamento automático dos dados nos arquivos victim_ip.txt e login_info.txt dentro do diretório sites/facebook/, conforme exibido no terminal.

```
[*] Victim IP Found!
[~] Victim IP: 127.0.0.1
[~] Saved: sites/facebook/victim_ip.txt
[*] Login info Found!
[~] Account: teste_usuario
[~] Password: teste_senha
[~] Saved: sites/facebook/login_info.txt
[~] Waiting for Next Login Info, Press Ctrl + C to exit ...
[*] Victim IP Found!
[~] Victim IP: 127.0.0.1
[~] Saved: sites/facebook/victim_ip.txt
█
```

1.7 Passo 4

Print da atividade 1.7: Execução do comando whois itapaje.ce.gov.br, demonstrando a consulta às informações de registro do domínio junto ao Registro.br, incluindo dados do responsável, servidores DNS, datas de criação e alteração, status do domínio e contatos administrativos e técnicos.

```

```

1.8 Passo 10

Print da atividade 1.8: Acesso à interface do Maltego Graph (Desktop 4.1.1) na aba *Maltego Data Hub*, demonstrando os hubs de dados disponíveis, categorias de informações e integrações para coleta e análise de dados em investigações.

1.9 Passo 9

Print da atividade 1.9: Execução de transforms no Maltego Graph a partir da entidade *Website (ufc.br)*, demonstrando a expansão do grafo com entidades relacionadas (DNS e domínio), bem como o painel de *Transform Output* exibindo o processamento e os resultados das

consultas realizadas.

1.10 Passo 8

Print da atividade 1.10: Demonstração do passo 8, evidenciando o sucesso do ataque adversarial onde uma placa de "Pare" é erroneamente classificada como "120km/hr" com 99.91% de probabilidade.

⚠ It looks like you're not using Google Chrome. This demo **may not work properly**. If it breaks, please try in Google Chrome.

Break neural networks in your browser.

Everything runs client-side – there is no server! Try the demo:

Select a model: GTSRB (street sign recognition)

Original Image

NEXT IMAGE ↗

Prediction

RUN NEURAL NETWORK

Prediction: "Stop Sign"
Probability: 99.85%

✓ Prediction is correct.

Adversarial Image

Turn this image into a:
120km/hr

Select an attack:
Carlini & Wagner (stronger)

GENERATE

Can you see the difference? [View noise](#)

Prediction

RUN NEURAL NETWORK

Prediction: "120km/hr"
Probability: 99.91%

✗ Prediction is wrong. Attack succeeded!

What is the demo doing?

Neural networks achieve superhuman performance in many areas, but they are easily fooled.

In the demo above, we can force neural networks to predict anything we want. By adding nearly-invisible noise to an image, we turn "1"s into "9"s, "Stop" signs into "120 km/hr" signs, and dogs into hot dogs.

These noisy images are called [adversarial examples](#). They break the integrity of machine learning systems, and the illusion of their superhuman performance.

Why does this matter?

Our world is becoming increasingly automated, yet these systems have strange failure modes.

If machine learning systems are not properly defended, attackers could:

- Impersonate others in facial recognition systems
- Force autonomous vehicles to misrecognize street signs & obstacles
- Bypass content moderation and spam filters in social networks
- Inject adversarial bytes into malware to bypass antivirus systems
